President Trump defended Israel and condemned a UN Security Council resolution that condemned Israeli settlements. Trump said at a press conference on the G20 summit that he will not be taking sides in a conflict between

---

Israel and the Palestinians. He said he hopes that the United States will “be able to go to a very big peace process” but that the Palestinians need to be reasonable. Trump blamed the “disproportionate” criticism of Israel for the breakdown in the talks with the Palestinians and said that the Palestinians don’t want to negotiate. Trump accused the Palestinians of being “no fun” and said the deal they were originally seeking was so bad that it was “unfair.” Trump also criticized the American news media

for “dishonest” coverage of the situation, and said he doesn’t think CNN or MSNBC are “good” networks. The demand for higher performance semiconductor devices is creating an impetus for thinning the dielectric layers of these devices. In these thinned dielectric layers, the thickness of the dielectric constant is effectively reduced. In this regard, the capacitance of the dielectric layers between interconnections is reduced which limits the ability to lower the interconnection resistance and

---

capacitance. The use of additional dielectric material in order to increase capacitance also creates concerns of thinning the dielectric material on the order of 5-10 nanometers (nm) or more in the future. Currently, a common interlayer dielectric material used in semiconductor devices is silicon dioxide. With the reduction in thickness of the silicon dioxide dielectric layer, and the use of additional dielectric materials for increasing the capacitance, the reliability of the interconnection of

---

the semiconductor devices is adversely affected. Attempts have been made to improve the reliability of semiconductor devices by improving the quality of the electrical and physical interfaces between the dielectric layer and the interconnections. For example, improved interconnection reliability can be achieved through a refractory metal silicide layer, a conductive barrier layer and a low resistance adhesion layer. However, these technologies are complex and require complex manufacturing

processes. Therefore, a need exists for a method of forming an interconnection for a semiconductor device that exhibits a low resistivity and high reliability.[Progress of organ preservation in urologic oncology]. To 4bc0debe42
